PROFILE

Platform engineer who builds and runs services on Kubernetes and AWS. Experience spans Python and Java development, release automation, observability and production support. Work includes AI services that turn customer questions into database reports and engineering tickets into tested code changes.

EXPERIENCE

Loweconex

Lisburn, UK · Aug 2023 – Present

Platform & Site Reliability Engineer

Platform infrastructure, developer tooling and incident response for an IoT software business.

- **CI/CD & GitOps.** Co-built shared delivery pipelines for ~20 Java and Node services, supporting ~400 deployments a month across four environments. Separated image builds from dev deployment through ArgoCD reconciliation, and automated post-deploy checks and dev-to-QA promotion.
- **AI-assisted engineering.** Built Nightshift, a Python service that implements engineering tickets, updates versions and proposes security fixes. Delivered pen-test tickets through a Jira-to-PR pilot, with automated checks and human review before merge. Designed the workflow to support incident response.
- **Natural-language analytics.** Took Clarity, a Java/Spring Boot service, from prototype to production so users can ask questions of their data and download reports without writing SQL. Added schema context, read-only database access and SQL validation to keep queries within each customer's data.
- **Developer tooling.** Built Heimdall, a Python service bringing together Jira tickets, pull requests, deployments and test results across 22 service repositories. Gave engineers one place to see where a change is deployed, spot stalled releases and investigate deployment drift.
- **Observability & reliability.** Built self-hosted metrics, logs and tracing across four environments using Prometheus, Thanos, Loki, Tempo and Grafana. Enabled investigations across AWS accounts and linked 72 alerts to runbooks. Checked monitoring-pipeline alert thresholds against historical metrics.
- **LLM infrastructure.** Took the shared language-model gateway from proof of concept to a service used by customer features and engineering agents, with access controls, budgets and usage tracking. Built automated code review into the shared CI/CD pipeline alongside build and security checks.

OD3 Engineering

Magherafelt, UK · Aug 2021 – Aug 2022

Software Developer (Industrial Placement)

- Built C#/.NET applications and integrations using the Tekla Structures API to automate structural design tasks and reduce manual drafting for in-house architects.

TECHNICAL

Platform & IaC: Kubernetes, EKS, ArgoCD, Helm, Kustomize, Terraform, AWS CDK, GitHub Actions, Bitbucket Pipelines.

AI Engineering: LiteLLM, tool calling, text-to-SQL, agent workflows, guardrails, canary evaluations.

Observability & Security: Prometheus, Grafana, Loki, Thanos, Tempo, OpenTelemetry, Veracode, SourceClear.

Cloud, Data & Languages: Python, Java, TypeScript, C#, Bash, SQL; AWS, PostgreSQL, TimescaleDB, Kafka, Redis.

EDUCATION

MSc Artificial Intelligence, Distinction (alongside work)

Queen's University Belfast · 2026

Dissertation: capacity-aware Kubernetes recovery scheduling, evaluated on real Amazon EKS clusters.

BSc Computer Science, 2:1

Queen's University Belfast · 2019 – 2023

First-class dissertation on deep learning for stock-price prediction.
